

## **The state independency metric: how effective is state run sports system on the Olympic stage.**

I have had a bit of experience of using Python for data analysis on academic projects and I wanted to do a simple straightforward project to combine Python and SQL to extract some data insights. I have come across an Olympics dataset – 120 years of data with every participant of the Olympic games since its beginning. Such analysis is interesting to perform and see, whether the system of state support in sport results in higher productivity of the athletes. As much as it is a method of propaganda, it also helps children find a purpose in life as well as helping people stay fit and healthy with mass sport culture. As trivial as that sounds, the success of the USSR's athletes in the Olympics is a great example of that. While the country joined the IOC in 1954 and have been competing until 1992\* the results are staggering and worth exploring a bit further.

| team          | count(team) |
|---------------|-------------|
| United States | 5219        |
| Soviet Union  | 2451        |
| Germany       | 1984        |
| Great Britain | 1673        |
| France        | 1550        |
| Italy         | 1527        |
| Sweden        | 1434        |
| Australia     | 1306        |
| Canada        | 1242        |

## My hypothetical client:

I am working closely with SportsStats to find interesting insights for their partners. Upon reviewing the data provided, there can hopefully be made news worthy stories or health insights.

## Hypotheses:

- 1) Outside of the USA, all of the state controlled sport system countries will perform better, than the amateur ones.
- 2) Each soviet country will have a time lag, in which the new system will be implemented. Therefore, the results of all will improve after 3 Olympic cycles from start of participation

## Approach:

1. Import and clean up data; split the raw dataset into 1<sup>st</sup> and 2<sup>nd</sup> word countries tables
2. Filter against teams and years to see performance
3. Run statistical analysis via Pearson and P-value to find correlations

## Step 1: Import and clean up data.

We begin by importing libraries and the csv of the dataset. Once imported, it is best to familiarize ourselves as to what data we have got.

```
import pandas as pd
import numpy as np
import matplotlib
import matplotlib.pyplot as plt
```

```
Raw_Data = pd.read_csv(r'athlete_events.csv')
Raw_Data.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 271116 entries, 0 to 271115
Data columns (total 15 columns):
ID                271116 non-null int64
Name              271116 non-null object
Sex               271116 non-null object
Age              261642 non-null float64
Height           210945 non-null float64
Weight           208241 non-null float64
Team              271116 non-null object
NOC               271116 non-null object
Games            271116 non-null object
Year             271116 non-null int64
Season           271116 non-null object

Medal            39783 non-null object
dtypes: float64(3), int64(2), object(10)
memory usage: 31.0+ MB
```

```
Raw_Data.head()
```

|   | ID | Name                    | Sex | Age  | Height | Weight | Team           | NOC | Games       | Year | Season | City      | Sport         | Event                            | Medal |
|---|----|-------------------------|-----|------|--------|--------|----------------|-----|-------------|------|--------|-----------|---------------|----------------------------------|-------|
| 0 | 1  | A Dijiang               | M   | 24.0 | 180.0  | 80.0   | China          | CHN | 1992 Summer | 1992 | Summer | Barcelona | Basketball    | Basketball Men's Basketball      | NaN   |
| 1 | 2  | A Lamusi                | M   | 23.0 | 170.0  | 60.0   | China          | CHN | 2012 Summer | 2012 | Summer | London    | Judo          | Judo Men's Extra-Lightweight     | NaN   |
| 2 | 3  | Gunnar Nielsen Aaby     | M   | 24.0 | NaN    | NaN    | Denmark        | DEN | 1920 Summer | 1920 | Summer | Antwerpen | Football      | Football Men's Football          | NaN   |
| 3 | 4  | Edgar Lindenu Aabye     | M   | 34.0 | NaN    | NaN    | Denmark/Sweden | DEN | 1900 Summer | 1900 | Summer | Paris     | Tug-Of-War    | Tug-Of-War Men's Tug-Of-War      | Gold  |
| 4 | 5  | Christine Jacoba Aafink | F   | 21.0 | 185.0  | 82.0   | Netherlands    | NED | 1988 Winter | 1988 | Winter | Calgary   | Speed Skating | Speed Skating Women's 500 metres | NaN   |

After looking through the columns, it is quite clear, that not all of the data provided will be necessary for the analysis. So we will drop some of them altogether.

```
Clean_Data = Raw_Data[['Name', 'Team', 'Games', 'Year', 'Sport', 'Event', 'Medal']]
Clean_Data.head()
```

|   | Name                     | Team           | Games       | Year | Sport         | Event                            | Medal |
|---|--------------------------|----------------|-------------|------|---------------|----------------------------------|-------|
| 0 | A Dijiang                | China          | 1992 Summer | 1992 | Basketball    | Basketball Men's Basketball      | NaN   |
| 1 | A Lamusi                 | China          | 2012 Summer | 2012 | Judo          | Judo Men's Extra-Lightweight     | NaN   |
| 2 | Gunnar Nielsen Aaby      | Denmark        | 1920 Summer | 1920 | Football      | Football Men's Football          | NaN   |
| 3 | Edgar Lindenau Aabye     | Denmark/Sweden | 1900 Summer | 1900 | Tug-Of-War    | Tug-Of-War Men's Tug-Of-War      | Gold  |
| 4 | Christine Jacoba Aaftink | Netherlands    | 1988 Winter | 1988 | Speed Skating | Speed Skating Women's 500 metres | NaN   |

Once we got the required columns filtered, it is time to split the dataset into soviet and capitalist. For the more accurate results, we will use the time constraints from 1954 -1992, since within that time the soviet system was implemented and active in the Warsaw pact countries.

```
from pandasql import sqldf
soviet = sqldf("SELECT * FROM Clean_Data WHERE TEAM in ('China','Soviet Union', 'East Germany','Bulgaria', 'Romania', 'Hungary',
soviet = sqldf("SELECT * FROM soviet WHERE MEDAL != 'None' AND YEAR >= '1952';")
soviet[["Team", "Medal", "Sport"]] = soviet[["Team", "Medal", "Sport"]].astype(str)
soviet.head()
```

|   | Name                             | Team         | Games       | Year | Sport      | Event   | Medal  |
|---|----------------------------------|--------------|-------------|------|------------|---|--------|
| 0 | Pter Abay                        | Hungary      | 1992 Summer | 1992 | Fencing    | Fencing Men's Sabre, Team                     | Silver |
| 1 | Zagalav Abdulbekovich Abdulbekov | Soviet Union | 1972 Summer | 1972 | Wrestling  | Wrestling Men's Featherweight, Freestyle      | Gold   |
| 2 | Irene Abel                       | East Germany | 1972 Summer | 1972 | Gymnastics | Gymnastics Women's Team All-Around            | Silver |
| 3 | Ismail Abilov (-Nizamolu)        | Bulgaria     | 1980 Summer | 1980 | Wrestling  | Wrestling Men's Middleweight, Freestyle       | Gold   |
| 4 | Viktor Andreyevich Aboimov       | Soviet Union | 1972 Summer | 1972 | Swimming   | Swimming Men's 4 x 100 metres Freestyle Relay | Silver |

```
capital = sqldf("SELECT * FROM Clean_Data WHERE TEAM NOT in ('China','Soviet Union', 'East Germany','Bulgaria', 'Romania', 'Hungary')
capital = sqldf("SELECT * FROM capital WHERE MEDAL != 'None' AND YEAR >= '1952';")
capital[["Team", "Medal", "Sport"]] = capital[["Team", "Medal", "Sport"]].astype(str)
capital.head()
```

|   | Name                     | Team    | Games       | Year | Sport         | Event                            | Medal  |
|---|--------------------------|---------|-------------|------|---------------|----------------------------------|--------|
| 0 | Juhamatti Tapio Aaltonen | Finland | 2014 Winter | 2014 | Ice Hockey    | Ice Hockey Men's Ice Hockey      | Bronze |
| 1 | Paavo Johannes Aaltonen  | Finland | 1952 Summer | 1952 | Gymnastics    | Gymnastics Men's Team All-Around | Bronze |
| 2 | Kjetil Andr Aamodt       | Norway  | 1992 Winter | 1992 | Alpine Skiing | Alpine Skiing Men's Super G      | Gold   |
| 3 | Kjetil Andr Aamodt       | Norway  | 1992 Winter | 1992 | Alpine Skiing | Alpine Skiing Men's Giant Slalom | Bronze |
| 4 | Kjetil Andr Aamodt       | Norway  | 1994 Winter | 1994 | Alpine Skiing | Alpine Skiing Men's Downhill     | Silver |

## Step 2: Filter against teams and years to see performance

Once we have our countries split into tables, it is time to see, how they performed on the global scale! We will create a function to count the medals of each country, as well as the overall contribution to the soviet pool of medals won.

```
def yearly_medals(year:int):
    filtr = soviet.loc[soviet['Year'] == year]
    table = sqldf('SELECT YEAR, TEAM, COUNT(TEAM) AS Medal_Count FROM filtr GROUP BY TEAM;')
    table['Gold_Count'] = sqldf('SELECT COUNT(TEAM) AS Gold_Count FROM filtr WHERE MEDAL = "Gold" GROUP BY TEAM;')
    table['Silver_Count'] = sqldf('SELECT COUNT(TEAM) AS Silver_Count FROM filtr WHERE MEDAL = "Silver" GROUP BY TEAM;')
    table['Bronze_Count'] = sqldf('SELECT COUNT(TEAM) AS Bronze_Count FROM filtr WHERE MEDAL = "Bronze" GROUP BY TEAM;')

    fig, ax = plt.subplots()

    cmap = plt.get_cmap("tab20c")
    outer_colors = cmap(np.arange(10))

    ax.pie(table['Medal_Count'], colors=outer_colors, labels=table['Team'],
           wedgeprops=dict(edgecolor='w'), autopct="")

    ax.legend(table['Team'],
              title="Countries",
              loc="center left",
              bbox_to_anchor=(1.5, 0, 0.5, 1))

    ax.set(aspect="equal", title='Soviet medal distribution')
    plt.show()
    return table
```

Активация Windows

When we run the function with the first 3 Olympic cycles, we get the following:

```
yearly_medals(1952)
```

|   | Year | Team           | Medal_Count |
|---|------|----------------|-------------|
| 0 | 1952 | Bulgaria       | 1           |
| 1 | 1952 | Czechoslovakia | 25          |
| 2 | 1952 | Hungary        | 102         |
| 3 | 1952 | Poland         | 4           |
| 4 | 1952 | Romania        | 4           |
| 5 | 1952 | Soviet Union   | 117         |
| 6 | 1952 | Yugoslavia     | 24          |

yearly\_medals(1956)

| Year   | Team           | Medal_Count |
|--------|----------------|-------------|
| 0 1956 | Bulgaria       | 18          |
| 1 1956 | Czechoslovakia | 7           |
| 2 1956 | Hungary        | 66          |
| 3 1956 | Poland         | 20          |
| 4 1956 | Romania        | 19          |
| 5 1956 | Soviet Union   | 206         |
| 6 1956 | Yugoslavia     | 23          |

yearly\_medals(1960)

| Year   | Team           | Medal_Count |
|--------|----------------|-------------|
| 0 1960 | Bulgaria       | 7           |
| 1 1960 | Czechoslovakia | 23          |
| 2 1960 | Hungary        | 66          |
| 3 1960 | Poland         | 32          |
| 4 1960 | Romania        | 15          |
| 5 1960 | Soviet Union   | 209         |
| 6 1960 | Yugoslavia     | 17          |

Judging by the numbers presented, the trend is not consistent across the board. USSR, Bulgaria, Czechoslovakia, Poland and Romania show increase in medals as the time passes. However, Hungary (who finished 3<sup>rd</sup> overall in 154 Olympics) and Yugoslavia show downward trend. It is also worth noting, that until 1964, Germany participated as a unified country, so it will be a good idea to look into the medal situation from 1968 games.

yearly\_medals(1968)

| Year   | Team           | Medal_Count |
|--------|----------------|-------------|
| 0 1968 | Bulgaria       | 26          |
| 1 1968 | Cuba           | 10          |
| 2 1968 | Czechoslovakia | 50          |
| 3 1968 | East Germany   | 56          |
| 4 1968 | Hungary        | 81          |
| 5 1968 | Poland         | 37          |
| 6 1968 | Romania        | 23          |
| 7 1968 | Soviet Union   | 225         |
| 8 1968 | Yugoslavia     | 29          |

yearly\_medals(1972)

|   | Year | Team           | Medal_Count |
|---|------|----------------|-------------|
| 0 | 1972 | Bulgaria       | 22          |
| 1 | 1972 | Cuba           | 22          |
| 2 | 1972 | Czechoslovakia | 49          |
| 3 | 1972 | East Germany   | 163         |
| 4 | 1972 | Hungary        | 81          |
| 5 | 1972 | Poland         | 47          |
| 6 | 1972 | Romania        | 40          |
| 7 | 1972 | Soviet Union   | 255         |
| 8 | 1972 | Yugoslavia     | 18          |

yearly\_medals(1976)

|   | Year | Team           | Medal_Count |
|---|------|----------------|-------------|
| 0 | 1976 | Bulgaria       | 39          |
| 1 | 1976 | Cuba           | 24          |
| 2 | 1976 | Czechoslovakia | 34          |
| 3 | 1976 | East Germany   | 215         |
| 4 | 1976 | Hungary        | 55          |
| 5 | 1976 | Poland         | 73          |
| 6 | 1976 | Romania        | 55          |
| 7 | 1976 | Soviet Union   | 336         |
| 8 | 1976 | Yugoslavia     | 19          |

With the introduction of East Germany, most teams show the similar trend. USSR, East Germany, Bulgaria, Cuba, Poland, and Romania show increase in medals as the time passes. And Hungary, Yugoslavia (after a slight increase) and Czechoslovakia show downward trend. Which makes our second hypothesis a bit of a mixed batch – most countries start showing better results with time, but there are some of the countries, that show opposite trend.

We will use the same build of the function to establish, which countries in the capitalist block contribute most to overall medal performance.

```
def yearly_medals_cap(year:int):
    filt = capital.loc[capital['Year'] == year]
    table1 = sqldf('SELECT YEAR, TEAM, COUNT(TEAM) AS Medal_Count FROM filt GROUP BY TEAM;')
    table1 = sqldf('SELECT * FROM table1 WHERE Medal_Count >= "20" GROUP BY TEAM;')

    fig, ax = plt.subplots()

    cmap = plt.get_cmap("tab20c")
    outer_colors = cmap(np.arange(10))

    ax.pie(table1['Medal_Count'], colors=outer_colors, labels=table1['Team'],
           wedgeprops=dict(edgecolor='w'), autopct="")

    ax.legend(table1['Team'],
              title="Countries",
              loc="center left",
              bbox_to_anchor=(1.5, 0, 0.5, 1))

    ax.set(aspect="equal", title='Capitalist medal distribution')
    plt.show()
    return table1
```

yearly\_medals\_cap(1972)

|   | Year | Team          | Medal_Count |
|---|------|---------------|-------------|
| 0 | 1972 | Australia     | 20          |
| 1 | 1972 | Finland       | 20          |
| 2 | 1972 | France        | 25          |
| 3 | 1972 | Great Britain | 29          |
| 4 | 1972 | Italy         | 28          |
| 5 | 1972 | Japan         | 59          |
| 6 | 1972 | Norway        | 25          |
| 7 | 1972 | Sweden        | 28          |
| 8 | 1972 | United States | 195         |
| 9 | 1972 | West Germany  | 102         |

yearly\_medals\_cap(1976)

|    | Year | Team          | Medal_Count |
|----|------|---------------|-------------|
| 0  | 1976 | Australia     | 23          |
| 1  | 1976 | Canada        | 28          |
| 2  | 1976 | Finland       | 22          |
| 3  | 1976 | France        | 21          |
| 4  | 1976 | Great Britain | 33          |
| 5  | 1976 | Italy         | 35          |
| 6  | 1976 | Japan         | 41          |
| 7  | 1976 | Netherlands   | 20          |
| 8  | 1976 | New Zealand   | 25          |
| 9  | 1976 | United States | 173         |
| 10 | 1976 | West Germany  | 102         |

The two games summaries provided allow us to compare the performance of the soviet against capitalist countries. Once the metric was calculated, it turned out that highest performing capitalist countries were more productive until 1968. However, outside of USA, these countries performed better than their soviet counterparts until the rise of East Germany and its contributions, tipping the scales from 1972 onward.

(\*NOTE: we excluded 1980 & 1984 Olympics, due to the boycott from capitalist countries in 1980 and soviets in 1984 respectively.)

After running the function on all of the games, we managed to isolate the best performing countries. Now we can create a table of their most productive disciplines, so we can determine, which system was best at a given sport and what field was proving most fruitful for each block.

```
table_cap = sqldf('SELECT * FROM capital JOIN table_dis_cap ON table_dis_cap.T = capital.Team;')
table_cap = table_cap[["Team", "Medal", "Sport"]]
table_p = pd.pivot_table(table_cap, values='Medal', index=['Sport'],
                        columns=['Team'], aggfunc=lambda x: len(x))
table_p = table_p.fillna(0)
table_p.head()
```

| Team             | Algeria | Angelita | Argentina | Armenia | Australia | Austria | Austria-1 | Azerbaijan | Bahamas | Belarus | ... | Unified Team | United States | U Si |
|------------------|---------|----------|-----------|---------|-----------|---------|-----------|------------|---------|---------|-----|--------------|---------------|------|
| Sport            |         |          |           |         |           |         |           |            |         |         |     |              |               |      |
| Aeronautics      | 0.0     | 0.0      | 0.0       | 0.0     | 0.0       | 0.0     | 0.0       | 0.0        | 0.0     | 0.0     | ... | 0.0          | 0.0           |      |

All of the countries in question have several sports excellence to thank for their high performance. Upon filtering the country via the year of the games, we get the following results.

```
def capital_by_sport(year:int, team:str):
    fill = capital_top10.loc[capital_top10['Year'] == year]
    filt = fill.loc[fill['Team'] == team]
    table2 = sqldf('SELECT YEAR, SPORT, COUNT(SPORT) AS Medal_Count FROM filt GROUP BY SPORT;')

    fig, ax = plt.subplots()

    cmap = plt.get_cmap("tab20c")
    outer_colors = cmap(np.arange(10))

    ax.pie(table2['Medal_Count'], colors=outer_colors, labels=table2['Sport'],
           wedgeprops=dict(edgecolor='w'), autopct="")

    ax.legend(table2['Sport'],
              title="Disciplines",
              loc="center left",
              bbox_to_anchor=(1.5, 0, 0.5, 1))

    ax.set(aspect="equal", title='Capitalist discipline distribution')
    plt.show()
    return table2
```

capital\_by\_sport(1972, 'Australia')

Capitalist discipline distribution

| Year   | Sport     | Medal_Count |
|--------|-----------|-------------|
| 0 1972 | Athletics | 2           |
| 1 1972 | Cycling   | 3           |
| 2 1972 | Swimming  | 10          |

capital\_by\_sport(1976, 'Italy')

Capitalist discipline distribution

| Year   | Sport      | Medal_Count |
|--------|------------|-------------|
| 0 1976 | Athletics  | 1           |
| 1 1976 | Cycling    | 1           |
| 2 1976 | Fencing    | 12          |
| 3 1976 | Water Polo | 11          |

soviet\_by\_sport(1956, 'Hungary')

Soviet discipline distribution

| Year   | Sport      | Medal_Count |
|--------|------------|-------------|
| 0 1956 | Athletics  | 2           |
| 1 1956 | Fencing    | 19          |
| 2 1956 | Gymnastics | 17          |
| 3 1956 | Swimming   | 2           |
| 4 1956 | Water Polo | 11          |

soviet\_by\_sport(1976, 'Poland')

Soviet discipline distribution

| Year   | Sport         | Medal_Count |
|--------|---------------|-------------|
| 0 1976 | Athletics     | 8           |
| 1 1976 | Cycling       | 5           |
| 2 1976 | Football      | 17          |
| 3 1976 | Handball      | 14          |
| 4 1976 | Weightlifting | 3           |

These graphs indicate, that the soviet countries favor more team sports, where they went on to be a formidable force all throughout

the measured period. Individual disciplines were more adherent to what sporting school was strong for the individual country (\*skiing in the USSR). It is also visible, that the results improved after the soviet reform of the sporting system in the country, as well as finding the federations from scratch (\*Boxing in Cuba, which was not popularized until the revolution)

Capitalist countries, on the other hand, were better at individual disciplines – athletics, swimming, cycling. As later findings show, the sport most popularized or widespread in the country ends up taking charge in the medal hopes – like athletics for the USA, cycling for the UK or hockey for the UK and Australia.

### Step 3. Run statistical analysis via Pearson and P-value to find correlations

\*\*\*

**Pearson correlation** (the bivariate correlation) is a statistic that measures linear correlation between two variables X and Y. It has a value between +1 and -1, where 1 is total positive linear correlation, 0 is no linear correlation, and -1 is total negative linear correlation

**P-value** is the probability that you would have found the current result if the correlation coefficient were in fact zero (null hypothesis). If this probability is lower than the conventional 5% ( $P < 0.05$ ) the correlation coefficient is called statistically significant.

\*\*\*

We are going to find correlations between the performance of sports in each table. Since the biggest contributors to the medal pool are athletics and swimming, we will compare them first and then see, how well the other disciplines perform.

```
stats.pearsonr(top10_pivot['Athletics'], top10_pivot['Swimming'])  
(0.9367797733520323, 6.472434665113527e-05)
```

```
stats.pearsonr(sov_top10_pivot['Athletics'], sov_top10_pivot['Swimming'])  
(0.8818575028522808, 0.0007373334821925068)
```

Looks like the correlation is quite strong for both tables. This comes as no surprise, since we are looking at the most successful teams across the games. Let`s look at the correlation between athletics and cycling.

```
stats.pearsonr(top10_pivot['Athletics'], top10_pivot['Cycling'])  
(-0.19877405318324518, 0.5819584632960524)
```

```
stats.pearsonr(sov_top10_pivot['Athletics'], sov_top10_pivot['Cycling'])  
(0.9713231953684817, 2.858097325455921e-06)
```

This shows even stronger correlation, but our capitalist table gave a weak Pearson`s with a very high P-value. Hence, the correct result will be a non-linear correlation between these two. Situation is with the water sports bears close resemblance to the athletics-swimming pair: good performers in one usually perform well in the other.

```
stats.pearsonr(top10_pivot['Swimming'], top10_pivot['Rowing'])  
(0.8515852180042711, 0.0017675267129093372)
```

```
stats.pearsonr(sov_top10_pivot['Swimming'], sov_top10_pivot['Rowing'])  
(0.9284261829118636, 0.00010524384888481701)
```

```
stats.pearsonr(top10_pivot['Swimming'], top10_pivot['Water Polo'])  
(0.6029658837701221, 0.06500140121045224)
```

```
stats.pearsonr(sov_top10_pivot['Swimming'], sov_top10_pivot['Water Polo'])  
(0.23855281951807578, 0.5068617406656911)
```

However, the capitalist table shows more of a linear correlation, whereas soviet one looks like a non-linear relationship.

But what about team sports? Since the soviet teams should perform “so much better”? Well, the results are less than straightforward:

```
stats.pearsonr(top10_pivot['Football'], top10_pivot['Water Polo'])  
(-0.24939053917813606, 0.4871410772700129)
```

```
stats.pearsonr(sov_top10_pivot['Football'], sov_top10_pivot['Water Polo'])  
(0.8053904525595188, 0.004925349726905607)
```

```
stats.pearsonr(top10_pivot['Football'], top10_pivot['Handball'])  
(-0.16630739341706227, 0.6460986626927561)
```

```
stats.pearsonr(sov_top10_pivot['Football'], sov_top10_pivot['Handball'])  
(0.5355816581707947, 0.11059192903953714)
```

```
stats.pearsonr(top10_pivot['Basketball'], top10_pivot['Ice Hockey'])  
(0.5445533660108927, 0.10361711377836365)
```

```
stats.pearsonr(sov_top10_pivot['Basketball'], sov_top10_pivot['Ice Hockey'])  
(0.7349329446193686, 0.015457666887141088)
```

The relationships in the capitalist table shows hardly any correlation, whereas the soviet performance is more linear, although not entirely.

# Conclusions

1. Adoption of the soviet sport system improves the performance of every country with every consecutive games, even though the biggest benefactor, judging by the results was the USSR
2. Capitalist countries with independent systems of preparation show more consistent results in their strongest disciplines.
3. Eastern European school of gymnastics gave a huge advantage to the soviet countries. From early 1950s, gymnastics popularization became widespread for the “improvement of physical wellbeing of soviet people”. Later that decree transformed into a way to earn more medals at the highest level, which resulted in soviet dominance on the Olympic stage. Apart from Japan, no other capitalist country was decisively better performing at the Olympics.
4. A special mention needs to be attributed to fencing. As a competitive sport, it originated in Italy, who long has been the most formidable force in the sport. Much praise can also be said about the Hungarian school of fencing, considered second best in Europe. After the European division, the high standards of Hungarian fencing were taught all over the soviet block, resulting in much improvement of the soviet athletes.
5. The strong schools of each country, joining the soviet block, contributed to the other countries` training methods. Soviet system took the experience of one nation and adopted the practice. Good examples – fencing, gymnastics and water polo

# Hypotheses: Verdict

1. **Outside of the USA, all of the state controlled sport system countries will perform better, than the amateur ones.**

Partially correct – from the 1972 games onward

2. **Each soviet country will have a time lag, in which the new system will be implemented. Therefore, the results of all will improve after 3 Olympic cycles from start of participation.**

Partially correct – some countries showed downward trend.

After the 1968 inclusion of East Germany, all countries showed a steady growth.

## Discussion.

As much as sports were a method of political propaganda for the soviet regime, it was a mass phenomenon, that drew from the best practices of the countries it harbored and implemented them across the board. The same approach was taken by China in preparation for 2008 games – and it propelled them to become one of the major forces at the games. There is much room in international cooperation, when it comes to best training methods to make the games more competitive and the pool of victors wider and more inclusive of other nations.

Thank you for reading, you can find the code on my GitHub, any feedback, comments, suggestions for this would be much appreciated!
